The Southampton Hand Assessment Procedure (SHAP) is a clinically validated hand function test. Originally developed to assess the effectiveness of upper limb prostheses, the SHAP has now been applied to assessment of musculoskeletal and neurological conditions.

A timer is included to time the various SHAP tasks.

The SHAP kit is housed within a heavy-duty metal case for ease of transport and storage.

Light and heavy versions of the 6 abstract objects to enforce classical patterns of prehension.

14 activities of daily living (ADL) tasks.

The online SHAP test centre allows you to generate scores.*

*computer and monitor not included
